■ sense of lack of reality

■ Accompanied by \_\_\_\_\_

Discociativa Discordora						
Dissociative Disorders						
■ Group of disorders based on the phenomenon of dissociation -						
■ Conceptualized as being on a continuum from day dreaming to highway hypnosis to pathological						
dissociation						
■ Common with extreme anxiety						
Types of Dissociative Disorders						
■ 1. Depersonalization Disorder						
■ 2. Dissociative (psychogenic) fugue						
■ 3. Dissociative (psychogenic) amnesia						
■ 4. Dissociative Identity Disorder (formerly MPD)						
Features of Dissociative disorders						
■ individual experiences an alteration of identity						
■ typically traumatically induced						
Adaptive features						
■ Escape from reality that is too overwhelming to deal with,						
■ "go off into their own world"						
■ these occur on a continuum from no pathology to severe						
Depersonalization Disorder						
don't feel like yourself						
■ like observing self, being outside of self						
■ Not the same as the near death experience						
■ But the experience may be similar						

- whole world seems unreal
- loss of sense of reality
- not "just spacing out" this is very distressing to the person involved
- relatively common among the Dissociative disorders and Anxiety disorders

Disso	-::	·~ [	
ロカミらい	CIAIIN	<i>/</i>	101116

- usually follows some serious pathological stress and may be associated with very heavy alcohol use
- usually lasts a short period of time
- recovery is usually rapid \_\_\_\_\_
- person does not remember what they did while in the fugue state
- distinction between fugue and amnesia fugue involves travel, amnesia doesn't

### Dissociative Amnesia

- not induced organically not from brain injury
- loss might be for some specific time or loss might be more generalized
- memory for these periods is often accessible under hypnosis
- recovery is usually very sudden spontaneous remission

## Dissociative Identity Disorder

- Formerly Multiple Personality Disorder or MPD
- classified as complex and chronic dissociative disorder characterized by a disturbances of identity and memory
- Symptoms/Behaviors
  - anxiety
  - depressed mood
  - severe headaches
  - memory disturbance
  - loss of time, blackout

•	
Core feat	tures of DID
■ Existe	ence of personalities who exchange control over the individual
<b>-</b>	is defined as an entity with firm, persistent, and well rounded self
■ alt	er has a characteristic and consistent pattern of relating to the world
■ the nu	imber of personalities is related to the severity and number of childhood traumatic events
(avera	age = 13 personalities)
<b></b>	- changing from one alter to another
■ ma	ay or may not be consciously done by the individual
■ ma	ay be triggered by an event in the environment (stressor)
■ se	e physical changes - facial (grimacing), postural, speech
■ ca	n also see sensitivity changes
	alter may have different threshold for pain, different response to alcohol or medications
■ Need	to differentiate the following
•_	
•	this is an important distinction to make
	these are totally different phenomena
■ Bi <sub>l</sub>	polar disorder scattered thoughts of mania
■ De	epression (with psychotic features)
■ Bo	orderline personality disorder
Etiology (	of DID
■ Childh	nood trauma
•_	% of DID sufferers have been abused
	MOST people who are abused do NOT develop DID
•	% are survivors of child sexual abuse
<b>.</b>	% experienced extreme neglect or abandonment as a child
	see in client's history
	utal form of abuse which involves rituals over an extended period of time

this is painful, humiliating, and severe

# Psychodynamic theory of DID

- Psychoanalytic and psychodynamic theories rely on repression and defense mechanisms
- \_\_\_\_\_ theory
- 1) possess the capacity to dissociate
- 2) experience overwhelming trauma that draws on the dissociative capacity as a defense mechanism
  - e.g., profound sexual or physical abuse by a parent)

# Kluft's 4 factor theory of DID

- 3) develop an alternate personality around naturally occurring phenomena
  - e.g., the hidden observer, ego states, or an imaginary companion
  - This prevents the personality from achieving a cohesive sense of self
- 4) experience the failure of significant others to protect the child from further trauma and reestablish normal development

## Braun & Sach's 3-P factor theory

- 3-P factor theory
- (1) \_\_\_\_\_\_: The genetic capacity to dissociate, and the repeated, long-term experience of severe childhood trauma.
- (2) \_\_\_\_\_: dissociation is triggered as a defensive mechanism
  - Through state dependent learning and other mechanisms, dissociative episodes become linked into alter personalities or fragments.
- - affects the shaping of the fragments
  - ensures the continuation of the personalities

#### Behavioral Theories of DID

- Behavioral position coping mechanism that is an avoidance move
  - Putnam (1985) disruption in the development task of learning to generalize across different states
     of consciousness

■ Everyone has different repertoires under specific contextual control ■ These contexts can evoke repertoires even when haven't been around for a period of time ■ e.g., grown child visiting parents ■

(resurgence, not repression)  Treatment goals may be different with this theory  DID Treatment  Primary goal is understanding and "integration" into one consistent self  goal is to uncover the traumatic experience in the person's childhood  make it so the client can tolerate having these experiences  Therapist must and at the same time must be respectful of the individual personalities
<ul> <li>Treatment goals may be different with this theory</li> <li>DID Treatment</li> <li>Primary goal is understanding and "integration" into one consistent self</li> <li>goal is to uncover the traumatic experience in the person's childhood</li> <li>make it so the client can tolerate having these experiences</li> <li>Therapist must and at the same time must be respectful of the individual personalities</li> </ul>
DID Treatment  ■ Primary goal is understanding and "integration" into one consistent self  ■ goal is to uncover the traumatic experience in the person's childhood  ■ make it so the client can tolerate having these experiences  ■ Therapist must  and at the same time must be respectful of the individual personalities
<ul> <li>Primary goal is understanding and "integration" into one consistent self</li> <li>goal is to uncover the traumatic experience in the person's childhood</li> <li>make it so the client can tolerate having these experiences</li> <li>Therapist must and at the same time must be respectful of the individual personalities</li> </ul>
■ goal is to uncover the traumatic experience in the person's childhood  ■ make it so the client can tolerate having these experiences  Therapist must and at the same time must be respectful of the individual personalities
<ul> <li>make it so the client can tolerate having these experiences</li> <li>Therapist must</li> <li>and at the same time must be respectful of the individual personalities</li> </ul>
Therapist must  and at the same time must be respectful of the individual personalities
the same time must be respectful of the individual personalities
the same time must be respectful of the individual personalities
see the whole person and the parts at the same time
<ul> <li>Attempts to destroy specific personalities in a DID client have, historically, failed miserably</li> </ul>
Controversy of DID
■ This disorder is of questionable rarity
<ul> <li>controversy as to whether it is more or less rare than originally thought</li> </ul>
may be valid diagnosis (not as rare) because:
•
<ul> <li>there is a growing belief in the authenticity of the diagnosis</li> </ul>
<ul> <li>there is a growing belief in the authenticity of the diagnosis</li> <li>the incidence of DID may have been under reported before now</li> </ul>

may be "diagnosis of the year(s)"

\_\_\_\_

- Before the book Sybil in 1973, there were only about 75 cases of this disorder in recorded history
- mostly between 1876 and 1920, with only 8 reported between 1960 and 1970
- Now estimates are \_\_\_\_\_ diagnosed cases
- vast majority of psychologists and psychiatrists have never seen a single case
  - a very small minority of clinicians report the great majority of cases
- Special hospital units collect huge amounts of insurance money to treat multiple personality.
  - not unusual for the treatment of one multiple personality patient to cost \$1 million
  - One case cost \$2.75 million
  - When one woman reached her \$1 million insurance limit, the hospital put her into a state facility, which then determined she had no significant mental illness and discharged her
